

Zhicheng Fu

This is my first version TSTL test. I test if Expression function can interpret some basic equations. These equations include real number, imaginary number, complex number and variables as basic units. And these equations use "+", "-", "*", "/", "^" as operators. Also these equations include some basic build-in functions like sin(), cos().

To run this version of TSTL test, you would better install numpy library.

To install the library, you can follow the instructions below:

1. type "sudo su" in the terminal and type the password.
2. type "cd ~"
3. type "git clone <https://github.com/alphaomega-technology/Equation>"
4. type "cd Equation"
5. type "python setup.py install"

To run the TSTL test, firstly type "tstl first.tstl --nocover".

Then type "python randomtester.py --nocover". Then you can test the library.
